

title: "Crash course on psycholinguistic experiments: a practical training on how to design, run and analyze linguistics-based experiments such as judgment/decision tasks, reading and visual world eye tracking experiments."

description: "the goal of this course is to provide the students with the know-how of designing, running and analyzing their own experiments. An open-source and user-friendly python based toolkit will be employed and the students will receive a practical training on how to develop a real experiment during the course, so that they will be able to conduct almost any kind of psycholinguistic experiment in their future career without the need of additional software/equipment."

requirements: "the only requirement for this course is *not* to be scared of programming a few lines of code. No prior programming or specific computer experience is required. Bringing your own laptop is a good thing, but not necessary (other laptops may be available or group work can be performed)
